

What would a day in the life of a Relationship Manager look like...

...if bank data, knowledge, applications and AI capabilities worked together as one intelligent system?

FRONTIER RM

A governed, human-controlled relationship workspace

The RM spends the day assembling context

Signals exist across systems, but the work of connecting them still falls to the relationship manager.

01

Find the client context

Search accounts, holdings, profile, consent and previous interactions.

02

Interpret the need

Connect lifecycle events, objectives, liquidity, risk and market context.

03

Prepare the conversation

Read correspondence, find guidance and assemble a client-specific talk track.

04

Record the follow-up

Draft the email, create the CRM record and preserve the evidence trail.

The opportunity is not another assistant. It is an intelligent operating layer around the RM.

One governed system around the RM

Data and AI do the synthesis. The RM owns the judgment, suitability decision and client relationship.

From morning signal to governed follow-up

The experience follows relationship-manager work, not the underlying product boundaries.

John remains accountable at every transition.

What you are about to see

A simple route through the cockpit, with the slide deck used only for context and architecture.

DEMO PRINCIPLE

Prepared, not automated. Explained, not opaque. Drafted, not executed.

Three artifacts, one governed progression

Each stage produces something the RM can inspect, challenge and improve.

01

Prepare briefing

Pre-meeting objective, client context, what changed, talk track, questions, sources and mandatory checks.

02

Custom recommendations

Explicitly fictional product candidates, fit rationale, risks, alternatives, evidence and suitability gates.

03

Opportunity draft

Editable client email and CRM opportunity record. Nothing is sent or committed.

WHY THIS?

Every artifact carries evidence, public decision rules, alternatives, assumptions, limitations and unresolved checks.

Microsoft Fabric: governed client evidence

Structured customer, portfolio, opportunity, compliance and event context is prepared through a medallion architecture.

SCREENSHOT PLACEHOLDER · MICROSOFT FABRIC

Insert the Frontier-RM-EBC workspace or Lakehouse / medallion screenshot.

Replace this grouped placeholder with your screenshot. Keep the title and callout visible.

Suggested callout: 20 fictional clients · Bronze / Silver / Gold · schema-enabled Lakehouse

Semantic Model and Power BI: a trusted analytical contract

Direct Lake measures and relationships turn platform data into RM-ready business concepts.

SCREENSHOT PLACEHOLDER · POWER BI · SEMANTIC
MODEL

Insert the model diagram, DAX validation, or Power BI report screenshot.

Replace this grouped placeholder with your screenshot. Keep the title and callout visible.

Suggested callout: 7 tables · 8 measures · Direct Lake · DAX-validated monetary evidence

Fabric IQ Ontology: relationships become traversable

The ontology expresses customers, households, accounts, holdings, products, events and opportunities as a connected business graph.

SCREENSHOT PLACEHOLDER · FABRIC IQ ONTOLOGY

Insert the Ontology entity/relationship graph or definition view.

Replace this grouped placeholder with your screenshot. Keep the title and callout visible.

Suggested callout: 11 entities · 11 relationships · 11 bindings · graph routing deferred pending readiness

Sources and Copilot: client voice meets approved knowledge

Correspondence and documents add intent and history; Copilot keeps process knowledge available across the workflow.

SCREENSHOT PLACEHOLDER · SOURCES · COPILOT

Insert a split screenshot of the Daniel Lim source thread and the persistent Frontier Copilot panel.

Replace this grouped placeholder with your screenshot. Keep the title and callout visible.

Suggested callout: realistic authored Outlook / SharePoint-style context · no Microsoft 365 connection

Microsoft Foundry: specialists with bounded responsibilities

The orchestrator coordinates customer intelligence, market context and meeting preparation, then verifies evidence coverage.

SCREENSHOT PLACEHOLDER · MICROSOFT
FOUNDRY

Insert the Foundry project, agent versions, or Fabric project connection screenshot.

Replace this grouped placeholder with your screenshot. Keep the title and callout visible.

Suggested callout: Orchestrator v2 · Customer Intelligence v3 · Market Context v2 · Meeting Preparation v2

Operations: evidence, handoffs and verification are observable

Presenters can inspect verified, revision-requested and rehearsal captures without exposing private model reasoning.

SCREENSHOT PLACEHOLDER · OPERATIONS · AGENT
REPLAY

Insert the agent fleet, captured-run selector and event stream screenshot.

Replace this grouped placeholder with your screenshot. Keep the title and callout visible.

Suggested callout: captured-live replay ≠ continuous execution · synthetic signal telemetry is separate

One intelligent system, clear evidence boundaries

The value comes from coordinated contracts, not from collapsing every component into one model.

What the intelligent system will not do

Boundaries are part of the product experience, not a disclaimer added at the end.

No hidden reasoning

Expose evidence and concise rationale, never private chain-of-thought.

No unsupported facts

Fail closed when governed client evidence is missing.

No suitability shortcut

KYC, consent, objectives, liquidity, horizon and risk remain gates.

No autonomous execution

Drafted, not sent. Prepared for CRM, not committed.

From application navigation to client judgment

The system returns time and attention to the work only the RM can do.

BEFORE

- Search for context
- Reconcile conflicting signals
- Draft from a blank page
- Document provenance manually

WITH FRONTIER RM

- Priorities already sequenced
- Evidence already connected
- Artifacts already prepared
- Judgment remains with John

More time for trust, advice and the client relationship.

THE QUESTION WE STARTED WITH

What would a day in the life of a Relationship Manager look like...

...if the bank worked as one intelligent system?

It looks like evidence arriving before the question, artifacts arriving before the blank page, and human judgment remaining in control.

FRONTIER RM · DATA + KNOWLEDGE + APPLICATIONS + AI
